

This is the user manual for **JASP for Audit**, a module within the free and open-source statistical software program **JASP** (<https://jasp-stats.org>) built to support the statistical aspects of an audit. The module offers a user-friendly graphical interface, simplifying complex statistical auditing procedures to make them as effortless as possible.

Next to the classical frequentist statistical techniques that are standard in audit practice, the module offers state-of-the-art Bayesian techniques that enable auditors to work more efficiently and transparently. Furthermore, JASP for Audit helps the auditor in interpreting, explaining, and reporting the analyses and leaves a transparent audit trail.
